

## Description

---

Paxton Solo is a phone based, cloud-hosted access control system, which is a cost effective alternative to traditional systems and requires no on site servers or management computers. It combines the simplicity of a standalone system with the flexibility and scalability of a networked solution, and enables installers and end users to deploy and manage access control quickly and securely, with no infrastructure. The system administration and door access are managed through a single mobile application, which reduces installation complexity and ongoing maintenance.

These are subscription credits to be used with the Paxton Solo access control system. Paxton Solo includes a free mode for 1 door and 1 user. Once additional doors or users are added, 6 credits per door controller per month are required.
